CC composition of matter comprising the above polypeptide; (10) a CC composition of matter comprising the above (chimeric) polypeptide, CC antibody, oligopeptide or TAT binding organic molecule, in combination CC with a carrier; (11) an article of manufacture comprising a container and CC the composition of matter contained within the container; (12) methods of CC inhibiting the growth of a cell that expresses the above protein, where CC the growth of the cell is at least in part dependent upon a growth CC potentiating effect of the above protein; (13) a method of the cells that express the above protein; (13) a method of cells that express the above protein; (14) a method of determining the protein of a protein in a sample suspected of containing the protein CC described above; (15) methods of diagnosing the presence of a tumour in a CC disorder associated with increased expression or activity of the above protein; and (17) a method of binding an antibody, oligopeptide or CC organic molecule to a cell that expresses the protein described above. CC The TAT sequences have cytostatic activities, and can be used in gene CC therapy. The composition and methods are useful for diagnosing, preparing CC a medicament for the therapeutic treatment or diagnostic detection of a medicament for the therapeutic treatment or diagnostic detection of a cell proliferative disorder or cancer. The present sequence represents a composition.
                                                      TAT cDNA sequence
                                                           from
                                             the present invention.

```

New nucleic acid molecule and encoded polypeptide, is preventing or treating cell proliferative disorders NO 3468; 5504pp; English for diagnosing, such as cancer.

The present invention describes an isolated tumour-associated antigenic ct target (TAT) nucleic acid comprising; (a) any of 4622 nucleotide (c) at (c) the complement of (a) or (b); (d) a sequence that has 80% (e) (a); (c) the complement of (a) or (b); (d) a sequence that has 80% (c) sequence identity to (a)-(c); or (e) a sequence that hybridises to (a)-(c) (c). Also described: (1) an expression vector comprising the above nucleic acid; (2) a host cell comprising the above expression vector; (3) (c) a process for producing a polypeptide; (4) an isolated polypeptide (c) an isolated polypeptide (c) an isolated polypeptide (c) an isolated polypeptide (c) an isolated antibody that binds comprising the above expression vector; (3) (c) an isolated antibody that binds to the above polypeptide; (6) an isolated antibody that binds to the above polypeptide; (6) an isolated antibody; (8) an amino acid sequences; or (c) a sequence (c) an isolated antibody; (9) at tumour-associated antigenic target (TAT) binding organic molecule that binds to the above polypeptide; (1) a process (c) an isolated antibody; (9) at tumour-associated antigenic target (TAT) (c) binding organic molecule that binds to the above polypeptide; (1) a process (c) antibody, oligopeptide; (9) at tumour-associated antigenic target (TAT) (c) binding organic molecule, (in combination (in a composition of matter comprising the above polypeptide; (10) a nicleated antigenic target (TAT) (c) antibody, oligopeptide; (1) an article of manufacture comprising a container and (c) the composition of matter contained within the container; (12) methods of (c) inhibiting the growth of a cell that expresses the above portein, where (c) the spread above; (13) methods of diagnosing the protein (c) a method of binding organic molecule to a cell that expresses the above portein (in a sample suspected of containing the protein (in a

                                                                                                                                                                                                                                                                                                                                                                                          The present invention relates to a new PRC17 polypeptide. The invention is useful for detecting cancer cells (such as prostate tissue, breast tissue, lung tissue, ovarian tissue) in a biological sample. The invention is further useful for monitoring the efficacy of a therapeutic treatment of a cancer (prostate cancer, ovarian cancer, lung cancer, breast cancer). The molecules of the invention are useful diagnostically or prognostically to detect diseases or conditions associated with altered PRC17 activity or expression relative to normal, for example cancer. The present nucleic acid sequence encodes the human PRC17 protein splice variant 1 of the invention. The human PRC17 gene is located on chromosome 17q11-12
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Novel isolated PRC17 polypeptide useful diagnostically or prognostically to detect diseases or conditions associated with altered PRC17 activity or expression relative to normal, for example cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  WPI; 2002-706902/76.

```

The present invention relates to novel proteins and the sequences (ADC37168-ADC37455), which activate nuclear factions and their coding sequences are used a disease associated with NF-kappaB activation, such as autoimmune diseases, cancers, infectious diseases, bone neurodegenerative diseases, or ischaemic disorders.

HYSEQ INC

New polynucleotides comprising sequences assembled from expressed sequence tags (ESTs), useful for treating cell-proliferative, neurodegenerative, autoimmune, genetic, myeloid or lymphoid, or plor coagulation disorders. WPI; 2002-759812/82. P-PSDB; ABP69593. or platelet

Claim 1; SEQ ID NO 692; 1012pp + Sequence Listing; English.

nucleotide sequence selected from any of 948 sequences (ABZ11119-CR ABZ12066) or their mature protein coding portion, active domain coding protein or complementary sequences. The polynucleotides are useful for cleantifying expressed genes or for physical mapping of human genome. The encoded polypeptides (ABP68902-ABP69849) are useful as molecular weight cleantifying screening and diagnostic assays and for treating cell-imaging, screening and diagnostic assays and for treating cell-crectiferative disorders (cancer), neurodegenerative diseases (Parkinson's cleantifying genetic disorders, myeloid or lymphoid disorders, cleantifying genetic disorders, wound, burns, incision, ulcers, cleantifies, etc. Note: The sequence data for this patent did not form part cleantifies, etc. Note: The sequence data for this patent did not form part cleantifies at figure of the printed specification, but was obtained in electronic format cleantifies at figure of the printed specification, but was obtained pot\_sequences invention relates to an isolated polynucleotide (I) comprising a (ABZ11119-

                                                                                                                                                                                                                                                                                                            US-10-071-838-2
                                                                                                                                                                                                                                                                                                                                                                                               The invention relates to an isolated polynucleotide. The methods and compositions of the present invention are useful for the diagnosis and/or treatment of diseases or conditions associated with aberrant expression or activity of the arginine-rich protein-like polypeptides, such as cancer and inflammation. They can also be used in forensics, gene mapping, identification of mutations responsible for genetic disorders, and in assessing biodiversity. The present sequence represents a novel human arginine-rich protein cDNA.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           New isolated arginine-rich protein-like polynucleotides and polypeptides, useful for diagnosing and/or treating conditions associated with aberrant activity of the arginine-rich polypeptides, such as cancer and inflammation.

                                                                                                                                                                                                                                                                                                              The present invention relates to novel proteins and their coding sequences (ADC37168-ADC37455), which activate nuclear factor kappa B (NF. kappaB). The proteins and their coding sequences are useful for treating a disease associated with NF-kappaB activation, such as inflammation, autoimmune diseases, cancers, infectious diseases, bone diseases, AIDS, neurodegenerative diseases, or ischaemic disorders.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                03-DEC-2001; 2001JP-00368692.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          460
```

The invention relates to an isolated polynucleotide (I) comprising a nucleotide sequence selected from any of 948 sequences (ABZ11119-CC ABZ12066) or their mature protein coding portion, active domain coding protein or complementary sequences. The polynucleotides are useful for identifying expressed genes or for physical mapping of human genome. The encoded polypeptides (ABP68902-ABP69849) are useful as molecular weight imaging, screening and diagnostic assays and for treating cell-compositive disorders (cancer), neurodegenerative diseases (Parkinson's CC or Alzheimer's disease), autoimmune diseases (multiple sclerosis, CC diabetes, lupus) genetic disorders, myeloid or lymphoid disorders, composited to roagulation disorders, wound, burns, incision, ulcers, liver of the printed specifications (bacterial, viral, fungal, parasitic), at the printed specification, but was obtained in electronic format composition at ftp.wipo.int/pub/published\_pct\_sequences Claim 1; or coagulation disorders SEQ Ħ ğ 691; 1012pp + Sequence Listing; 띰 gligh.
